Patent No. 6551795

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCEEC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDCMONAS TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,190
PRIOR APPLICATION NUMBER: US 60/074,190
RAIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-27
NUMBER OF ES QID NOS: 33142
SEQ ID NO 30374
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               261 EFLNEFNLICRENNLIINDNKTKVDNFPFVDKSSKSDIFSFFENITSTN'SNDKWIKEISN 320

Patent No. 6551795
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.118
CURRENT APPLICATION NUMBER: US/09/252,991A
PRIOR FILING DATE: 1999-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18

No. 1s the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                              US-09-613-486-15

                                                                                                   This is the amino acid sequence of a 22 kDa coat protein that is encoded by open reading frame ORF6 (see AAV08B7C) of grapevine leafforl virus type 2 (GLRAV-2) RNA (see AAV08B7C) of grapevine coat proteins 4 (see AAV08B6T-2) for a genome includes 9 open reading frames (see AAV08B6T-2) for a genome includes 9 open reading frames (see AAV08B6T-2) for a polyprotein, an RNA-dependent RNA polymerase, heat shock proteins, coat proteins of unknown function (see AAW13476-84). These can be used proteins of unknown function (see AAW13476-84). These can be used to produce probes and primers for secting molecules can be used to produce probes and primers for secting molecules can be used to produce probes and primers for secting vitis, Agrobacterium tumefaciens, grape, citrus, beet or tobacco citris, Agrobacterium tumefaciens, grape, citrus, beet or tobacco citris, and produce transferm host ceils (claimed). They can be used to impart diama-2 resistance to vitis scion or rootstock cultivars or nicoteance to plants or inspart beet yellows virus resistance to beet cultivars or thisteza vitus resistance to citrus scion cultivars (claimed).

The protein has mol. wt. 22.2 kb. The corresponding gene was obtained from preverse transcribed RNA isolated from purified SBYV. The fragment is useful for the production of virus resistant transperic plants by genetic engineering methods. "Jpdated on 25-MAR-2003 to correct PN field.)

preparing a medicament for treating, preventing and/or alleviating diseases associated with yeast or fungi or proliferative disorders, such as concer, or for preventing apoptosis in certain diseases. The compounds or polypeptides, or the genetically modified organism are useful for preparing a medicament for modifying the endogenic flora of humans and other mammals. The vaccine is useful for immunising against yeast or fungal infections. Apoptosis-related diseases include autoimmune disease, ischaemia, diseases related with viral infections or neurodegenerations. This sequence represents a polypeptide associated with the Bax gene described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          LMASWKLGPVJATGSTTVLKTAESTPLSALYLSQLLVEAGMPKGVINIVSGFGATAGAAI 232

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     303
                                                                                                                                                                                                                                                                                                                                                   The invention relates to identifying target proteins (ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences to manno acid sequences using suitable search parameters, where plant sequences having an E-value sequences are selected of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as herbicides.
                                                                                                                                                                                                                                                                   Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   252 KDSVLYNEKLQNLLPQIEASIPG-SKFLYADVYN--PMMEMIQNPSK-----YGFKETKR

The present invention relates to the genomic sequence of Pyrococcus abyssi (see AAF86431 and AAH41223-7) and P. abyssi proteins. P. abyssi is a hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to 110 degrees centifizade.

Note: This patent is in the same patent family as WO200065C62, which contains additional sequences as shown in AAB899132-AAB99143,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ------VVTEGDLKKVidGCAPLTRFIN-KLRTFGRTFT 116

This sequence represents a grapevine leafroll virus (GLRaV-5) protein construct of the invention. The DNA sequence can be used in an expression construct. The construct is useful for providing resistance to GLRaV infection in a recombinant plant cell by transforming the plant cell with it, where transcription of the polymucleotide sequence interferes with a normal viral function such as movement, encapsidation or replication of viral RNA. The polymucleotide sequence is expressed as an antisense viral RNA. The polymucleotide sequence is expressed as an antisense cat encodes a GLRaV coat protein, preferably a defective GLRaV coat protein or edication of useful for the synthesis of GLRaV, as diagnostics and probes, for viral seem mapping and for induced plant disease resistance. It is also useful to detect and quantitate expression of GLRaV in plant tissue prior to use in vegetative propagation, by detecting the presence of GLRaV RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 TTSPKVQRADSDVIFSNSFGERNVVVTEGDLKKVLDGCAPLTRFTNKLRTFGRTFTEAYV 120

```
This sequence represents a 46.5 kD immunogenic fragment of the protective polypeptide antigen (PPA) of the bacterium Erysipelothrix this loperthiae. This bacterium infects livestock, particularly pigs (swine erysipelas), and is also able to cause disease in humans. The recombinantly produced PPA fragment may be used as a subunit vaccine for stimulating an immune response in animals against Brysipelothrix rhusiopathiae. As the vaccine can be produced recombinantly, it can be produced on a large scale. The vaccine is suitable for transmucous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  50; Indels 29; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                             Novel recombinant protective polypeptide antigen useful as a vaccine for protecting livestock against Erysipelothrix rhusiopathiae infection

/note="The polyprotein encompasses domains for papain-like leader proteinase, putative methyltrensferse, RNA helicase and RNA-dependent RNA polymerase (RARp); ORFIa/b; papain-like leader Broteinase is capable of autoproteolytic release from the rest of the polyprotein, and is a replicational enhancer. RARp is presumably expressed via a +1 ribosomal frameshift"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /protein_id="AAF14300.1"
